

Short-Term Energy Outlook

STEO

May 2023

The U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy (DOE), prepared this report. By law, our data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report do not represent those of DOE or any other federal agencies.

Short-Term Energy Outlook

Overview

U.S. energy market indicators	2022	2023	2024
Brent crude oil spot price (dollars per barrel)	\$101	\$79	\$74
Retail gasoline price (dollars per gallon)	\$3.97	\$3.33	\$3.09
U.S. crude oil production (million barrels per day)	11.89	12.53	12.69
Natural gas price at Henry Hub (dollars per million British thermal units)	\$6.42	\$2.91	\$3.72
U.S. liquefied natural gas gross exports (billion cubic feet per day)	10.6	12.1	12.7
Shares of U.S. electricity generation			
Natural gas	39%	40%	38%
Coal	20%	17%	16%
Renewables	22%	23%	26%
Nuclear	19%	19%	19%
U.S. GDP (percentage change)	2.1%	1.6%	1.8%
U.S. CO₂ emissions (billion metric tons)	4.96	4.83	4.81

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, May 2023

- Weather forecast.** Beginning with the May 2023 *Short-Term Energy Outlook* (STEO), our STEO model will combine a 30-year trendline and the National Oceanic and Atmospheric Administration's forecast to create our weather forecasts. This methodology change will result in warmer forecast weather in the United States in both the winter and in the summer. The change will involve a one-time shift that will decrease our heating degree day (HDD) forecast in 2023 by 1% and in 2024 by 4%, and increase our cooling degree day (CDD) forecast by 8% in 2023 and by 12% in 2024. The shift will affect some series that use weather as an independent variable.
- Natural gas consumption.** We forecast the second most U.S. natural gas consumption for electricity generation on record this summer (May–September), behind last year, and averaging about 38 billion cubic feet per day (Bcf/d). Compared with last month's forecast, we have increased natural gas consumption for electricity generation by about 2% for 2023 and 3% for 2024 because of our methodology change which results in more CDDs, and in more U.S. electricity generation during the summer.
- Coal consumption.** We expect coal consumption in the electric power sector will fall by 13% in 2023 compared with last year due to several factors, including lower natural gas prices, more generation from renewable sources, and coal plant retirements. However, because of more overall electricity generation compared with our April STEO, our forecast for coal-fired generation is slightly higher in 2023 than we forecast last month.

- **U.S. gasoline prices.** Retail gasoline prices in our forecast average around \$3.40 per gallon (gal) during the summer 2023 driving season (April–September), a 20% decrease from the summer of 2022. Regional summer gasoline prices range from near \$3.00/gal on the Gulf Coast to about \$4.30/gal on the West Coast.
- **Supplements.** We periodically publish report and article supplements to the STEO to provide an in-depth analysis of special topics related to our forecasts. This month’s *Between the Lines* articles discuss [residential electricity bills](#) and updates to our [western hydropower forecast methodology](#).

Notable forecast changes

current forecast: May 9, 2023; previous forecast: April 11, 2023	2023	2024
Brent spot price average (dollars per barrel)	\$79	\$74
Previous forecast	\$85	\$81
Percentage change	-7.5%	-8.3%
U.S. retail diesel prices (dollars per gallon)	\$3.90	\$3.62
Previous forecast	\$4.11	\$3.87
Percentage change	-4.9%	-6.4%
U.S. electric power sector generation from natural gas (billion kilowatthours)	1,604	1,558
Previous forecast	1,568	1,514
Percentage change	2.3%	2.9%
U.S. electric power sector generation from coal (billion kilowatthours)	694	673
Previous forecast	687	704
Percentage change	0.9%	-4.3%
U.S. heating degree days	3,965	4,007
Previous forecast	4,024	4,194
Percentage change	-1.5%	-4.5%
U.S. cooling degree days	1,552	1,566
Previous forecast	1,433	1,393
Percentage change	8.3%	12.4%

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook, May 2023*

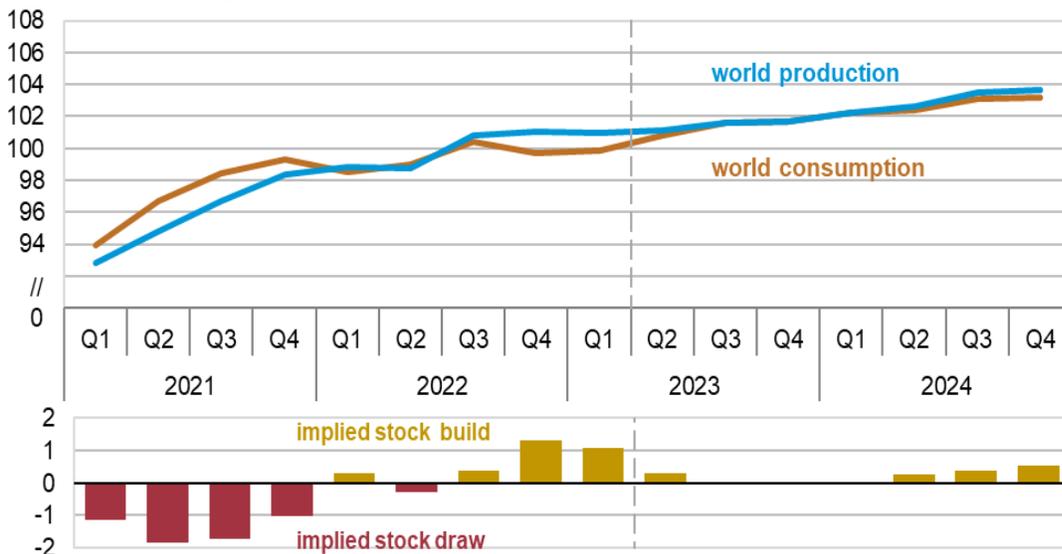

Global Oil Markets

Global oil demand and prices

The Brent crude oil spot price fell from an average of \$85 dollars per barrel (b) in April to close at \$73/b on May 4. At the beginning of April, OPEC and partner countries (OPEC+) announced a [cut to crude oil production of 1.2 million barrels per day \(b/d\)](#) through the end of 2023, which increased crude oil prices on expectations of tightening oil supplies. However, ongoing considerations about weakening global economic conditions, perceived risk around the global banking sector, and persistent inflation outweighed the initial increase in oil prices and have led to lower prices.

World liquid fuels production and consumption balance

million barrels per day

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, May 2023

Although demand growth for liquid fuels faces downside risks through the end of 2024, we expect the seasonal rise in oil consumption and a drop in OPEC crude oil production to put some upward pressure on crude oil prices in the coming months. Global liquid fuels consumption in our forecast increases by 1.6 million b/d in 2023 and by 1.7 million b/d in 2024, and most expected liquid fuels demand growth is in non-OECD Asia, led by China and India. We expect this demand growth will bring the global oil market into balance between the third quarter of 2023 (3Q23) and 1Q24 and push the Brent price from current levels back to between \$75/b and \$80/b.

Beginning in 2Q24, we expect consistent global oil inventory builds over the rest of the forecast period as global oil production outpaces global oil demand, putting downward pressure on crude oil prices. We forecast global oil inventories will grow by 0.3 million b/d in 2024, and we forecast the Brent crude oil spot price to average \$74/b in 2024, \$7/b lower than in last month's STEO.

Global oil supply

Global liquid fuels production in our forecast increases by 1.5 million b/d in 2023 compared with 2022 primarily because of [growth from non-OPEC producers](#). Excluding production from Russia, which we

forecast to fall by 0.3 million b/d in 2023, we expect that non-OPEC liquid fuels production will increase by 2.2 million b/d in 2023 and by an additional 1.1 million b/d in 2024.

We forecast Russia's crude oil and other liquid fuels production will decline from 10.9 million b/d in 2022 to 10.6 million b/d in 2023 and to 10.5 million b/d in 2024. Russia's production in March and April declined in part due to announced production cuts of 0.5 million b/d and maintenance at refineries in Russia, which we expect will end in June. Our assumption of a return to near-normal refinery operations contribute to a slight increase in Russia's liquids fuel production from 10.4 million b/d in the second quarter of 2023 to 10.5 million b/d through 2024.

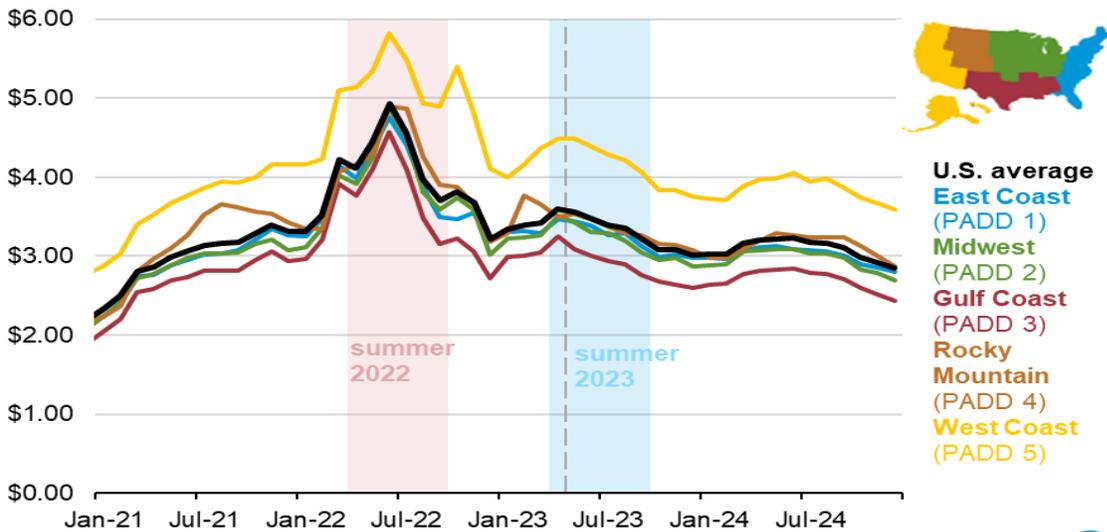

We forecast that total OPEC crude oil output will fall by 0.3 million b/d in 2023, in large part due to the April 3 OPEC+ announcement to cut production. In addition to the expected adherence to the voluntary production cuts, [recent disruptions to crude oil exports in Iraq](#) and a [force majeure limiting crude oil exports in Nigeria](#) have also reduced our near-term OPEC forecast in 2023. We forecast total OPEC liquid fuels production to increase by 0.6 million b/d in 2024 driven by the end of the current OPEC+ production cuts in 2023.

Petroleum Products

U.S. retail gasoline prices

The average U.S. regular gasoline retail price for April was \$3.60 per gallon (gal), which is higher than the \$3.53/gal we forecast in the April STEO. Inventory draws in April left U.S. gasoline inventories 3% below the five-year (2018–2022) minimum and contributed to rising retail gasoline prices. Because we reduced our crude oil price forecast in the May STEO, we now forecast gasoline prices in the summer driving months (April through September) to be slightly lower than previously expected across all regions of the United States. Overall, we expect retail gasoline prices to remain below summer 2022 prices, which reflects both lower crude oil prices this summer and lower refining margins for gasoline.

U.S. regular retail gasoline prices by PADD
dollars per gallon

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, May 2023

Regular gasoline retail prices are typically highest between the months of April and September because of more expensive summer-grade gasoline used to comply with [seasonal Reid vapor pressure \(RVP\) requirements](#) and high summer driving demand. We forecast summer 2023 retail gasoline prices to average about \$3.40/gal, which is 20% lower than the summer 2022 average of \$4.29/gal. Compared with summer 2022, when retail gasoline prices fell by more than \$1/gal from the \$4.93/gal peak in June to \$3.70/gal in September, we expect less volatility in prices in summer 2023. We forecast retail gasoline prices will fall from about \$3.60/gal in April to about \$3.20/gal in September. We expect a decrease in retail gasoline prices over the course of the summer partially because our expectation of rising refinery runs from global and U.S. refiners. U.S. refinery runs in our forecast reach their highest levels since 2019 as a result of high refinery margins and expanded capacity at [ExxonMobil’s Beaumont refinery](#) and Marathon Petroleum’s Galveston Bay refinery. Despite our expectation of rising refinery runs, U.S. gasoline supply and demand conditions remain tight, which we forecast will keep refinery margins above the five-year average.

U.S. gasoline prices vary regionally, reflecting local supply and demand conditions, different fuel specifications required by state laws, and taxes. Retail gasoline prices are usually the highest on the West Coast because of the region’s limited connections with other major refining centers, tight local supply and demand conditions, requirements for gasoline specifications that are more costly to manufacture, and higher taxes. We forecast West Coast retail gasoline prices to average more than \$4.30/gal in summer 2023, about 90 cents/gal higher than the U.S. average but almost \$1.00/gal lower than West Coast prices in summer 2022.

Regional gasoline prices are usually the lowest on the Gulf Coast, which holds about half of U.S. refining capacity and produces more gasoline than it consumes and where states generally have lower [gasoline taxes](#) than the national average. We forecast Gulf Coast retail gasoline prices to average about \$3.00/gal in summer 2023, more than 40 cents/gal lower than the U.S. average and nearly 90 cents/gal lower than

in summer 2022. We forecast the summer 2023 retail gasoline price to average close to \$3.30/gal on the East Coast and in the Midwest. Several factors present uncertainty in our retail gasoline price forecast for summer 2023. Our forecast assumes rising refinery runs and gasoline inventories that, if not realized, could leave gasoline prices higher than our forecast. In addition, changes in economic conditions and oil prices could affect retail gasoline prices.

Natural Gas

Natural gas consumption for electric power

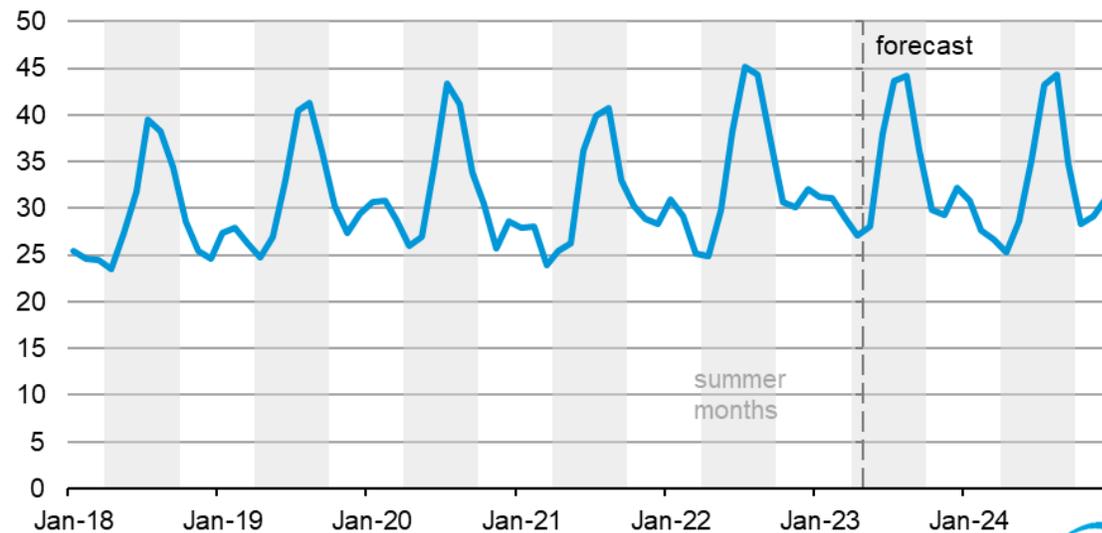

We forecast that natural gas consumed to generate electricity in the United States during the summer of 2023 (May–September) will average 38 billion cubic feet (Bcf/d), the second most on record behind the 39 Bcf/d recorded last year. U.S. natural gas consumption for electricity generation typically peaks in the summer months as warmer temperatures lead to more air-conditioning use.

High natural gas-fired electric power generation this summer is driven by a decline in coal-fired electricity generation, relatively low natural gas prices, and more overall electricity generation due to warmer-than-normal temperatures in our forecast. More electricity generation from renewable sources in 2023 compared with 2022 is one of the main reasons we do not expect natural gas consumption to reach a new record in 2023.

In the summer of 2024, we forecast natural gas consumed for electricity generation will decline by 2% and average about 37 Bcf/d, again driven lower by more renewable electricity generation sources coming online throughout 2023 and 2024.

Natural gas consumption for electric power

billion cubic feet per day

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, May 2023

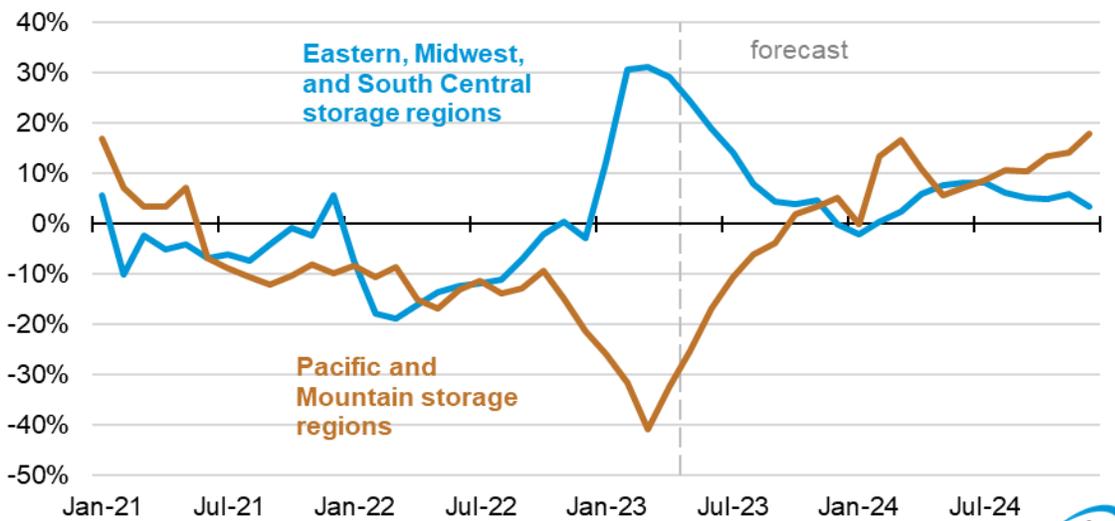

Natural gas regional storage

At the end of April, U.S. natural gas storage inventories totaled 2,114 billion cubic feet (Bcf), 19% more than the five-year (2018–2022) average. We forecast natural gas inventories will increase by 1,648 Bcf

from the end of April to reach 3,762 Bcf at the end of October, 4% more than the five-year average. Storage injections from April through October in our forecast are less than the five-year average because of high demand for natural gas in the electric power sector. We expect the U.S. benchmark Henry Hub natural gas spot price to average \$2.35 per million British thermal units (MMBtu) in May and rise to around \$3.00/MMBtu in July and August, when power demand peaks.

Above-average temperatures in the eastern and central United States this past winter and spring led to less natural gas storage withdrawals than average in those regions. In contrast, the western United States experienced colder-than-normal weather in winter and spring, which led to more natural gas storage withdrawals than average.

Regional natural gas storage inventories
percentage deviation from five-year average

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, May 2023

Natural gas storage inventories in the East, Midwest, and South Central storage regions were well above the five-year average at the end of April. Natural gas withdrawals were particularly low in the South Central storage region, leaving inventories at a surplus of almost 30% at the end of April. For all three regions, we forecast natural gas storage inventories to remain above the five-year average through the end of the injection season, ending October at a combined 120 Bcf (4%) above the five-year average.

Natural gas storage inventories in the Pacific and Mountain storage regions declined by more than is typical over the past winter, causing the deficit to the five-year average to reach more than 40% at the end of March. Colder-than-normal winter and spring weather, along with limited availability of hydropower for electricity generation in the Pacific region, reduced storage inventories. However, injections in these two regions in April were more than the five-year average, and we forecast inventories will increase by almost 300 Bcf from the end of April through the end of October, placing inventories at 2% more than the five-year average at the end of the injection season. The large increase in storage in these regions reflects inventory management by storage operators as they try to build inventories to have sufficient storage to meet winter requirements. Our expectation of high hydropower

generation in the west also reduces demand for natural gas in the power sector, which could also support natural gas storage injections.

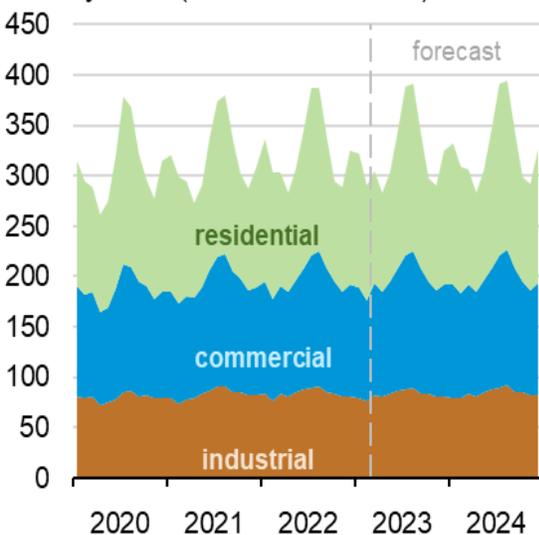

Electricity, Coal, and Renewables

Electricity consumption

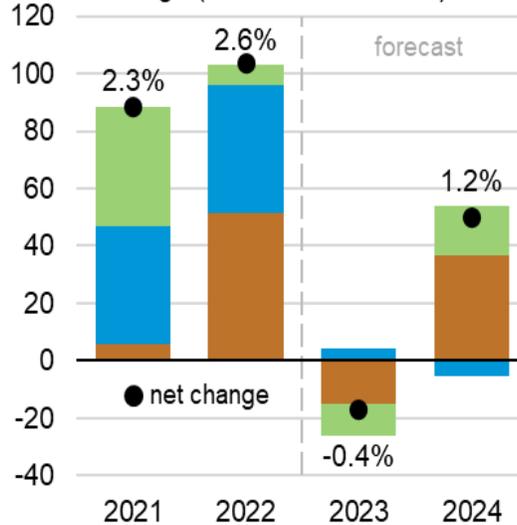

We expect total U.S. consumption of electricity in 2023 will be similar to 2022. Forecast sales of electricity to customers in the residential sector decline slightly from 2022. Residential electricity demand falls primarily because of milder winter temperatures; we forecast 7% fewer U.S. heating degree days in 2023 than last year. We expect [residential electricity demand and electricity bills](#) that are about the same or slightly higher than last summer, with similar summer temperatures offset by higher residential electricity prices.

U.S. sales of electricity to ultimate customers, by sector

monthly sales (billion kilowatthours)

annual change (billion kilowatthours)

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, May 2023

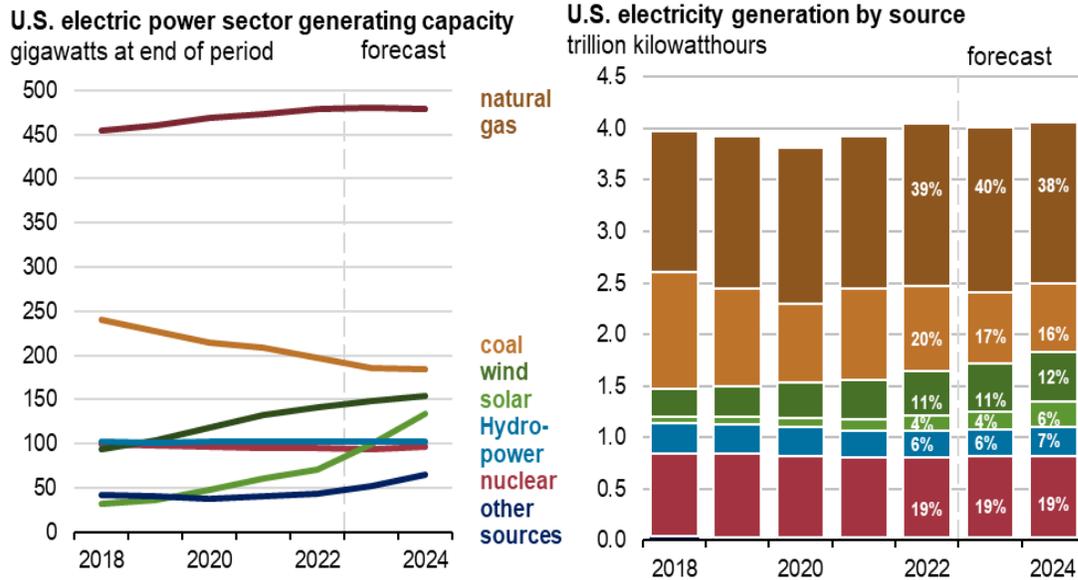

Industrial electricity demand is most affected by economic conditions. We forecast that U.S. electricity sales to industrial customers in 2023 will also be close to the same as in 2022, about 1% lower because of a 1% drop in manufacturing production in our forecast for 2023. We expect sales of electricity to the commercial sector will be almost unchanged in 2023.

Electricity generation

The forecast share of electricity generation from renewable sources rises from 22% in 2022 to 23% in 2023 and to 26% in 2024. This increase in renewable generation will reduce generation from fossil fuel-fired power plants in our forecast because renewable generators such as wind and solar have an advantage in dispatch due to their low operating costs. Improved water supply conditions should help increase hydroelectric generation over the coming months in [California and the Southwest](#).

We forecast that natural gas generation will increase slightly in the United States during 2023 in response to a significant decline in fuel costs. Natural gas’s share of U.S. generation averaged 39% in 2022, and we expect it will average 40% in 2023 before declining to 38% in 2024 as a result of the growing availability of renewable energy generating capacity and an increase of natural gas prices. Our forecast coal generation share declines from 20% last year to 17% in 2023 and 16% in 2024.

Data source: U.S. Energy Information Administration, *Short-term Energy Outlook*, May 2023

Coal markets

U.S. coal production in our forecast increases by 2% from April to May, as producers start to prepare for increased electricity generation during the summer months. After increasing in both 2021 and 2022, we expect U.S. coal production to decline by 3% from 597 million short tons (MMst) in 2022 to 577 MMst in 2023 and drop further (15%) to 491 MMst in 2024. Among the drivers of the decline in coal production is the ongoing retirement of coal-fired generating plants, low natural gas prices, and more renewable generation. About 11 gigawatts of coal-fired generating capacity is scheduled to retire in 2023, representing nearly 6% of the entire coal generating fleet. About three-quarters of the coal plant retirements will occur before July, which will limit coal-fired generation this summer.

Economy, Weather, and CO₂

U.S. macroeconomics

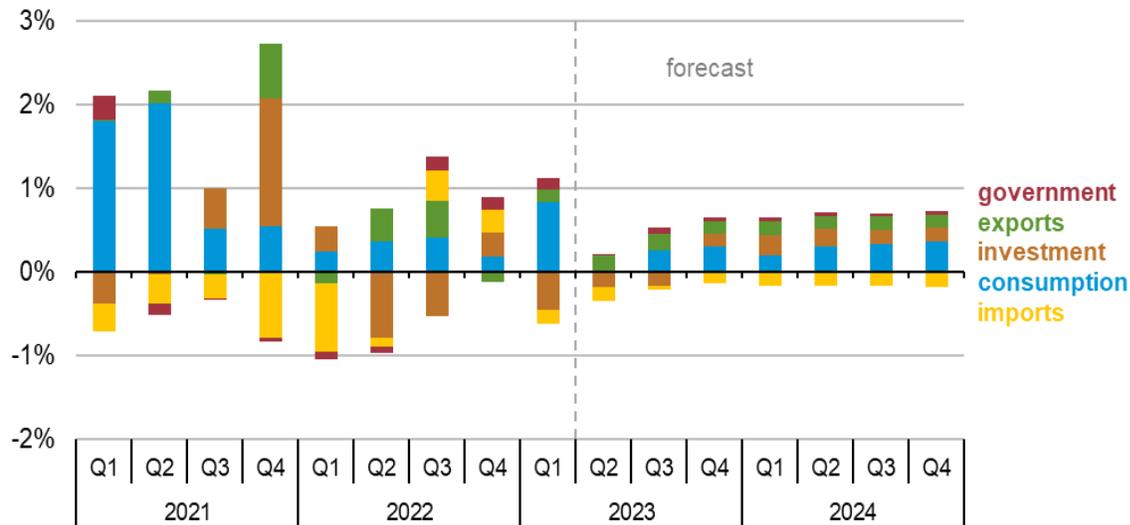

Our U.S. macroeconomic forecasts are based on S&P Global’s macroeconomic model. We incorporate STEO energy price forecasts into the model to obtain the final macroeconomic assumptions we use in the STEO.

S&P Global estimates that U.S. real GDP grew in the first quarter of 2023 (1Q23) but expects it to contract at an annualized rate of 0.2% in 2Q23. U.S. real GDP in our forecast returns to growth in 3Q23 and averages 1.6% growth throughout 2023 and 1.8% in 2024.

GDP growth largely reflects changes in real personal consumption expenditure (PCE), which grew by 1% in 1Q23 compared with 4Q22. PCE in our forecast remains flat in 2Q23. Aggregate investment is offsetting growth in PCE. As interest rates increased, borrowing costs rose and lowered residential fixed investment and private business inventories of goods. The declines in these categories cause the overall decline in aggregate investment, which is not expected to return to growth until 4Q23.

Contributions to GDP growth

weighted annualized percentage change

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, May 2023

Emissions

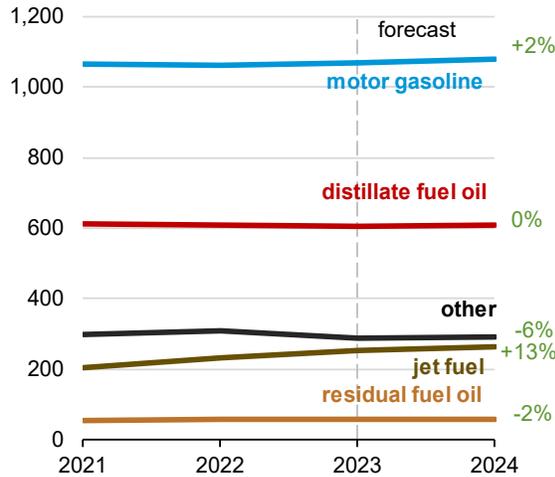

Total U.S. energy-related carbon dioxide (CO₂) emissions in our forecast decrease by 3% in 2023 and then remain flat in 2024. The largest changes in CO₂ emissions are from coal, which declines by 12% in 2023 due to less coal-fired electricity generation.

Emissions from natural gas fall slightly in both 2023 and 2024. Most 2023 reductions occur because of reduced space heating demand from residential and commercial buildings as a result of milder temperatures in 1Q23. Most 2024 reductions result from less natural gas-fired generation as the amount of generation from renewable sources grows.

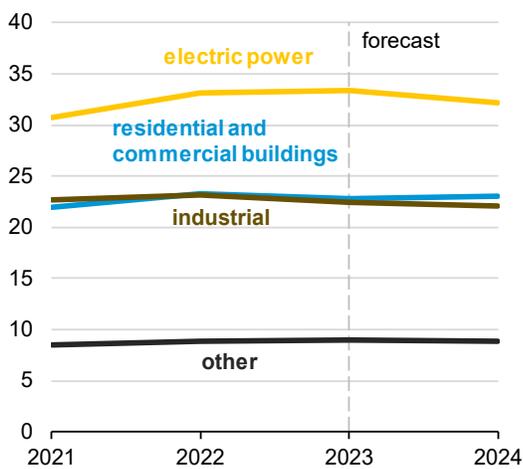

U.S. petroleum emissions remain mostly unchanged in 2023 and increase slightly in 2024. CO₂ emissions from petroleum are mostly associated with consumption of transportation fuels such as motor gasoline, diesel, and jet fuel. The consumption of both gasoline and jet fuel increases in our forecast through 2024, but the emissions from this increased consumption are offset by decreased emissions from other petroleum products in 2023.

U.S. energy-related CO₂ emissions

Petroleum emissions by product
(million metric tons)

Natural gas consumption by end use
(billion cubic feet per day)

Data source: U.S. Energy Information Administration, *Short-term Energy Outlook*, May 2023

Weather

To better reflect long-term warming trends, this month the STEO combines the 30-year trendline with the National Oceanic and Atmospheric Administration’s (NOAA) forecast to produce our weather forecasts. For the first forecast month we will continue to use data from NOAA, and for the remaining forecast period, we will use the 30-year trendline. Based on our new methodology, we now expect 1,552 cooling degree days (CDDs) in 2023 and 1,566 CDDs in 2024—an 8% increase in 2023 and a 12% increase in 2024 compared with our April 2023 STEO forecast, which was generated solely using NOAA’s 15-month forecast. Our heating degree day (HDD) forecast has been revised down from our April STEO by 1% in 2023 to 3,965 HDDs and by 4% in 2024 to 4,007 HDDs.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER). Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly*, DOE/EIA-0109; *Petroleum Supply Annual*, DOE/EIA-0340/2; *Weekly Petroleum Status Report*, DOE/EIA-0208; *Petroleum Marketing Monthly*, DOE/EIA-0380; *Natural Gas Monthly*, DOE/EIA-0130; *Electric Power Monthly*, DOE/EIA-0226; *Quarterly Coal Report*, DOE/EIA-0121; and *International Petroleum Monthly*, DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.

Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

 (c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly*,

DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Cr

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly*, DOE/EIA-0109; *Petroleum Supply Annual*, DOE/EIA-0340/2; *Weekly Petroleum Status Report*, DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to Petroleum Administration for Defense Districts (PADD).

See "Petroleum for Administration Defense District" in EIA's Energy Glossary (<http://www.eia.doe.gov/glossary/index.html>) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly*, DOE/EIA-0380;

Petroleum Supply Monthly, DOE/EIA-0109; *Petroleum Supply Annual*, DOE/EIA-0340/2; and *Weekly Petroleum Status Report*, DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions* (<http://ir.eia.gov/hgs/notes.html>).

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly*, DOE/EIA-0130; and *Electric Power Monthly*, Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (<http://www.eia.doe.gov/glossary/index.html>) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly*, DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (<http://www.reuters.com>).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Coal Market Indicators															
Coal Miner Productivity															
(Tons per hour)	6.05	6.05	6.05	6.05	5.98	<i>5.98</i>	<i>5.98</i>	<i>5.98</i>	<i>5.80</i>	<i>5.80</i>	<i>5.80</i>	<i>5.80</i>	6.05	<i>5.98</i>	<i>5.80</i>
Total Raw Steel Production															
(Million short tons per day)	0.253	0.253	0.247	0.235	0.236	<i>0.241</i>	<i>0.246</i>	<i>0.244</i>	<i>0.240</i>	<i>0.245</i>	<i>0.250</i>	<i>0.248</i>	0.247	<i>0.242</i>	<i>0.246</i>
Cost of Coal to Electric Utilities															
(Dollars per million Btu)	2.18	2.26	2.50	2.55	2.59	<i>2.58</i>	<i>2.57</i>	<i>2.52</i>	<i>2.52</i>	<i>2.52</i>	<i>2.52</i>	<i>2.49</i>	2.37	<i>2.56</i>	<i>2.51</i>

(a) Waste coal includes waste coal and coal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*,

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or collocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (<http://www.eia.doe.gov/glossary/index.html>) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (<http://www.eia.doe.gov/glossary/index.html>) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), continues on Table 7d part 2

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Notes:

(a) Chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

EIA completed modeling and analysis for this data on March 2, 2023.

Data sources:

- Historical data: EIA Preliminary Monthly Electric Generator Inventory (Form EIA-860M/EIA-860A surveys), December 2022; and Form EIA-861M (small-scale solar)
- Forecasts: EIA Preliminary Monthly Electric Generator Inventory and Short-Term Integrated Forecasting System.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Minor discrepancies with historical data in other EIA publications may occur due to frequent updates to the Preliminary Electric Generator Inventory.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.
 (b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib
 (c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.
 (d) Losses and co-products from the production of fuel ethanol and biomass-based diesel
 (e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.
 (f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.
 (g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226 and *Renewable Energy Annual*, DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (<http://www.eia.doe.gov/glossary/index.html>) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (<http://www.eia.gov/tools/glossary/>) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (<http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml>).
